```

Part 1 - Scraping and Saving HTML Content

Since LinkedIn has **strict antiscraping policies** and a **stable layout**, we prefer to use BeautifulSoup and Requests instead of Selenium to extract the data we need.

First we need to save the job listings url to a list for further usage.

In [2]:

```
# Initialize session and set headers
session = requests.Session()
headers = {
    'User-agent': 'Mozilla/5.0',
    'Accept':
'text/html,application/xhtml+xml,application/xml;q=0.9,image/webp,*/*',
    'Accept-Language': 'en-US,en;q=0.5',
    'Connection': 'keep-alive'
}

# Set base URL and query parameters
base_url = "https://www.linkedin.com/jobs/search/"
query_params = {
    'distance': '25',
    'geoId': '103644278',
    'keywords': 'data scientist',
```

```

    'origin': 'JOBS_HOME_KEYWORD_HISTORY',
    'refresh': 'true',
    'start': 0
}

```

```

In [3]: # Create a empty list to store the jobs' url
links = []

for page in range(1, 120):
    # Update the start value in the query parameter
    query_params['start'] = (page - 1) * 25
    try:
        response = session.get(base_url, params=query_params,
headers=headers)
        # Random sleep to avoid being detected as a bot
        time.sleep(random.uniform(10, 16))
        soup = BeautifulSoup(response.content, 'html.parser')

        # Find the list containing job results
        jobs_list = soup.find('ul', class_='jobs-search__results-
list')

        if jobs_list:
            # Extract all job cards from the list
            job_cards = jobs_list.find_all('li', recursive=False) #
'recursive=False' ensures it only looks at direct children
            for card in job_cards:
                link_tag = card.find('a', class_='base-card__full-
link')

                if link_tag and link_tag.get('href'):
                    links.append(link_tag.get('href'))

    except requests.exceptions.RequestException as e:
        print(e)
    except Exception as e:
        print(f"An error occurred: {e}")
# print(links)

```

HTTPSPool(host='www.linkedin.com', port=443): Max retries exceeded with url: /jobs/search/?distance=25&geoId=103644278&keywords=data+scientist&origin=JOBS_HOME_KEYWORD_HISTORY&refresh=true&start=300 (Caused by ProxyError('Cannot connect to proxy.', RemoteDisconnected('Remote end closed connection without response')))

```

In [4]: `len(links)`

Out[4]: 1560

We scraped **1,560** data scientist job listings.

However, many of them are **deduplicated** because a single job may be listed multiple times. And also because of the **antiscraping polies**, it's hard to parse all of them, so the actual number may **decrease** once we parse and individually save them to HTML files.

To avoid being blocked, we initially divide the list and then request and save each listing individually.

```
In [225... # Slice up the links to perform web-scraping to avoid being blocked
links1 = links[0:200]
links2 = links[200:400]
links3 = links[400:600]
links4 = links[600:800]
links5 = links[800:1000]
links6 = links[1000:1200]
links7 = links[1200:1400]
links8 = links[1400:1560]
```

In [227...

```
for link in links8:
    # Random sleep to avoid being detected as a bot
    time.sleep(random.uniform(5, 8))

    # Extract the job ID using regular expression
    job_id = re.search(r'jobs/view/.+-(\d+)\?', link)
    job_id = job_id.group(1)

    # Define the filename using the job ID
    filename = f"{job_id}.html"

    # For each of the listing URLs, use `requests` to fetch the
listing page
    page = requests.get(link, headers = headers)
    soup = BeautifulSoup(page.content, 'html.parser')

    # Save each HTML content to a separate file on disk
    with open(filename, 'w', encoding='utf-8') as file:
        file.write(soup.prettify())
    print(f"Successfully saved {filename}")

Part 2 - Get the needed information from the HTML files

Now, we loop through each HTML files we just saved, and extract the needed information.

In [234...

```
# Set the relative path  
directory = '/Users/yumi/ucdavis/Winter Quarter/BAX-422/Final  
Project/html files/'  
  
# create an empty list to store the job_info for future usage  
job_list = []  
  
# Loop through each saved HTML file from the path  
for filename in os.listdir(directory):  
    # Check if the file ends with .html  
    if filename.endswith(".html"):  
        # Construct the full file path using the relative directory  
        filepath = os.path.join(directory, filename)  
        # Read the file content  
        with open(filepath, 'r', encoding='utf-8') as file:  
            html_content = file.read()  
            # For each HTML file, use `BeautifulSoup` to parse the  
            file content  
            soup = BeautifulSoup(html_content, 'html.parser')  
  
            job_id = filename.split(".")[0]  
            job_title = soup.find('h1', class_='top-card-  
layout__title font-sans text-lg papabear:text-xl font-bold leading-  
open text-color-text mb-0 topcard__title')  
            if job_title:  
                job_title = job_title.get_text(strip=True)  
                company_name = soup.find('a', class_='topcard__org-name-

----
```

```
In [235]: len(job_list)
```

```
Out[235]: 265
```

As mentioned earlier, the number of listings decreased to 265.

We will store these in the 'LinkedIn' database for further analysis on the popularity.

Part 3 - Save the extracted data to MySQL database

Lastly, we import the extracted data into a MySQL database.

We use 'job_id' as the primary key because it is a unique identifier.

In [240...

```
# Ignore warnings
warnings.filterwarnings("ignore")
